

Patent  
10/763,542**LISTING OF CLAIMS**

Please cancel Claim 3.

1. (Previously Presented) An endovascular heat transfer device, comprising:
  - a working fluid supply, including a gear pump;
  - a flexible catheter capable of insertion to a selected vessel in the vascular system of a patient;
  - a heat transfer element attached to a distal end of said catheter, said heat transfer element comprising a plurality of heat transfer segments, each said heat transfer segment being encompassed by a smooth surface;
  - a smooth flexible tube connecting at least some of said heat transfer segments to adjacent said heat transfer segments; and
  - an inner tube disposed within said heat transfer element, said inner tube being connected in fluid flow communication with said gear pump.
2. (Original) The device recited in claim 1, wherein said gear pump is a helical tooth gear pump.
3. (Cancelled)
4. (Previously Presented) An endovascular heat transfer device, comprising:
  - a flexible catheter capable of insertion to a selected vessel in the vascular system of a patient;
  - a heat transfer element attached to a distal end of said catheter, said heat transfer element comprising a plurality of heat transfer segments, each said heat transfer segment being encompassed by a smooth surface;
  - a smooth flexible tube connecting at least some of said heat transfer segments to adjacent said heat transfer segments; and
  - an inner tube disposed within said heat transfer element, said inner tube being adapted to supply heat transfer fluid to the interior of said heat transfer element.
